LISTING OF CLAIMS

The following listing of claims replaces all prior versions or listings of claims pending in the application:

- 5 1. (currently amended) ~~A-2x2~~ An optical switch comprising:
a first dual-fiber collimator comprising a first pair of optical fibers, the first pair of optical
fibers including a first input fiber and a first output fiber;
a second dual-fiber collimator comprising a second pair of optical fibers, the second pair
of optical fibers including a second input fiber and a second output fiber;
10 a switching prism movable between a first position and a second position, wherein:
in the first position, the switching prism is positioned to direct light from the first
input fiber to the second output fiber, and direct light from the second
input fiber to the first output fiber; and
in the second position, the switching prism is positioned out of an optical path of
15 light emitted from the first input fiber and the second input fiber;
a first fixed planar mirror facing the first collimator, and aligned to reflect light from the
first input fiber into the first output fiber when the switching prism is in the
second position; and
a second fixed planar mirror facing the second collimator, and aligned to reflect light
20 from the second input fiber into the second output fiber when the switching prism
is in the second position.
2. (original) The switch of claim 1, wherein:
the first collimator and the second collimator are substantially parallel and face
25 opposite directions, and
the switching prism is parallelepiped-shaped.
3. (original) The switch of claim 1, wherein:
the first collimator and the second collimator are substantially parallel and face a
30 common direction; and

10/802,126 (OPT-115)

2/1/2005

the switching prism is a dovetail prism.

4. (original) The switch of claim 1, wherein:

the first mirror is positioned substantially a distance D_c away from an endface of the first collimator; and

the switching prism is sized and positioned according to a relation

$$S + (L/2 + W/2)/n = D_c,$$

wherein S is a distance between the endface of the first collimator and a transmissive face of the switching prism, W is a width of the switching prism along a direction parallel to a longitudinal central axis of the first collimator, L is a length of the switching prism along a direction perpendicular to the longitudinal central axis of the first collimator, and n is an index of refraction of the switching prism.

5. (currently amended) An optical switching method comprising:

positioning a switching prism in a first position in an optical path between a first dual-fiber collimator comprising a first pair of optical fibers, and a second dual-fiber collimator comprising a second pair of optical fibers,

employing the switching prism in the first position to direct light from an input fiber of the first collimator into an output fiber of the second collimator, and to direct light from an input fiber of the second collimator into an output fiber of the first collimator;

positioning the switching prism in a second position out of an optical path of light emitted from the input fiber of the first collimator and the input fiber of the second collimator;

reflecting light emitted from the input fiber of the first collimator into the output fiber of the first collimator when the switching prism is in the second position; and

using a fixed mirror to reflect reflecting light emitted from the input optical fiber of the second collimator into the output fiber of the second collimator when the switching prism is in the second position.

10/802,126 (OPT-115)

2/1/2005

6. (original) The method of claim 5, wherein:

the first collimator and the second collimator are substantially parallel and face opposite directions, and

5 the switching prism is parallelepiped-shaped.

7. (original) The method of claim 5, wherein:

the first collimator and the second collimator are substantially parallel and face a common direction; and

10 the switching prism is a dovetail prism.

8. (original) The method of claim 5, wherein:

the first mirror is positioned substantially a distance D_c away from an endface of the first collimator; and

15 the switching prism is sized and positioned according to a relation

$$S + (L/2 + W/2)/n = D_c,$$

wherein S is a distance between the endface of the first collimator and a transmissive face of the switching prism, W is a width of the switching prism along a direction parallel to a longitudinal central axis of the first collimator, L is a length of the switching prism along a direction perpendicular to the longitudinal central axis of the first collimator, and n is an index of refraction of the switching prism.

9. (currently amended) An optical switch comprising:

25 a first dual-fiber collimator comprising a first pair of optical fibers;

a second fiber collimator comprising an output optical fiber;

a switching prism movable between a first position and a second position, wherein:

in the first position, the switching prism is positioned to direct light from an input fiber of the first collimator into the output fiber of the second collimator,

30 and

10/802,126 (OPT-115)

2/1/2005

in the second position, the switching prism is positioned out of an optical path of light emitted from the input fiber of the first collimator; and
a first fixed mirror facing the first collimator, and aligned to reflect light from the input fiber of the first collimator into an output fiber of the first collimator when the
5 switching prism is in the second position.

10. (original) The switch of claim 9, wherein:
the first collimator and the second collimator are substantially parallel and face opposite directions, and
10 the switching prism is parallelepiped-shaped.

11. (original) The switch of claim 9, wherein:
the first collimator and the second collimator are substantially parallel and face a common direction; and
15 the switching prism is a dovetail prism.

12. (original) The switch of claim 9, wherein the second collimator is a dual-fiber collimator including a second pair of optical fibers, the second pair of optical fibers including the output fiber of the second collimator.
20

13. (original) The switch of claim 12, further comprising a second mirror facing the second collimator, and aligned to reflect light from an input fiber of the second collimator into the output fiber of the second collimator.

25 14. (original) The switch of claim 9, wherein:
the first mirror is positioned substantially a distance D_c away from an endface of the first collimator; and
the switching prism is sized and positioned according to a relation
 $S + (L/2 + W/2)/n = D_c$,

10/802,126 (OPT-115)

2/1/2005

wherein S is a distance between the endface of the first collimator and a transmissive face of the switching prism, W is a width of the switching prism along a direction parallel to a longitudinal central axis of the first collimator, L is a length of the switching prism along a direction perpendicular to the longitudinal central axis of the first collimator, and n is an index of refraction of the switching prism.

15. (currently amended) An optical switching method comprising:

positioning a switching prism in a first position in an optical path between a first dual-fiber collimator comprising a first pair of optical fibers, and a second fiber collimator comprising an output optical fiber, employing the switching prism in the first position to direct light from an input fiber of the first collimator into the output fiber of the second collimator, positioning the switching prism in a second position out of an optical path of light emitted from the input fiber of the first collimator; and employing a fixed mirror to reflect ~~reflecting~~ light emitted from the input fiber of the first collimator into an output fiber of the first collimator when the switching prism is in the second position.

16. (original) The method of claim 15, wherein:

the first collimator and the second collimator are substantially parallel and face opposite directions, and the switching prism is parallelepiped-shaped.

17. (original) The method of claim 15, wherein:

the first collimator and the second collimator are substantially parallel and face a common direction; and the switching prism is a dovetail prism.

10/802,126 (OPT-115)

2/1/2005

18. (original) The method of claim 15, wherein the second collimator is a dual-fiber collimator including a second pair of optical fibers, the second pair of optical fibers including the output fiber of the second collimator.

5 19. (original) The method of claim 18, further comprising reflecting light emitted from an input fiber of the second collimator into an output fiber of the first collimator when the switching prism is in the second position.

20. (original) The method of claim 15, wherein:
10 the first mirror is positioned substantially a distance D_c away from an endface of the first collimator; and
the switching prism is sized and positioned according to a relation
 $S + (L/2 + W/2)/n = D_c$,
wherein S is a distance between the endface of the first collimator and a transmissive
15 face of the switching prism, W is a width of the switching prism along a direction parallel to a longitudinal central axis of the first collimator, L is a length of the switching prism along a direction perpendicular to the longitudinal central axis of the first collimator, and n is an index of refraction of the switching prism.
